Pete Beckman & Jack Dongarra

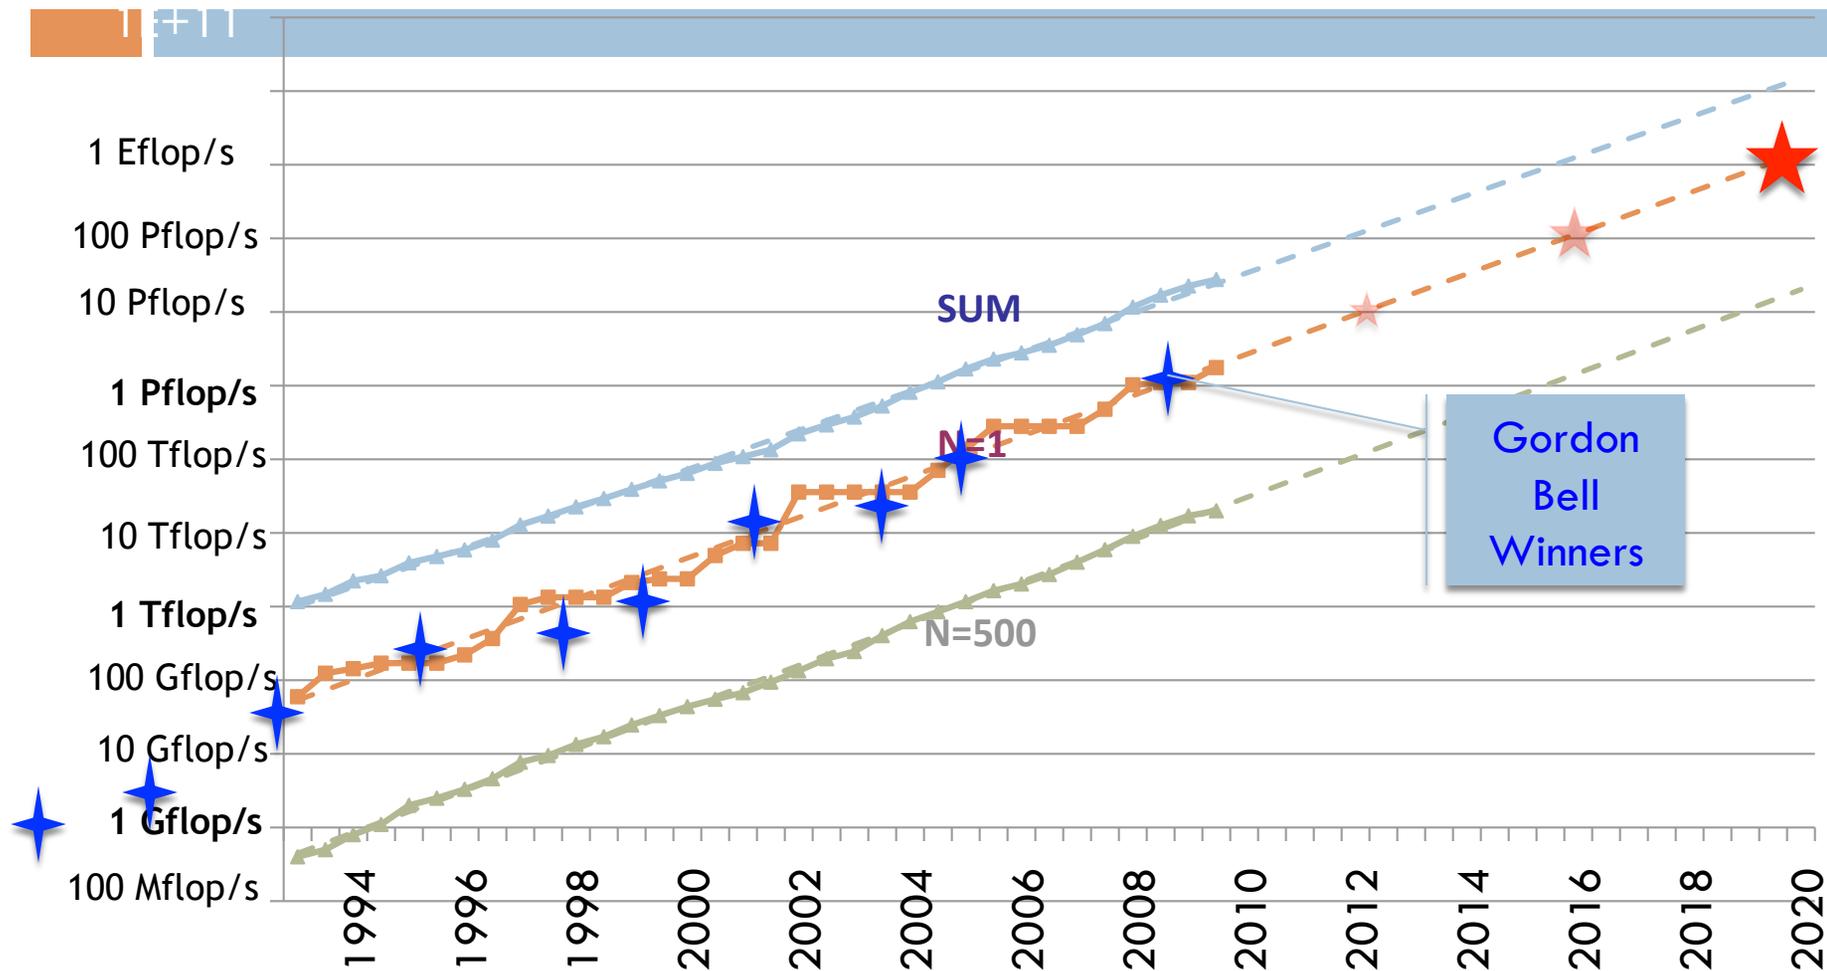

Looking at the Gordon Bell Prize

(a slide from Cray :-)

- 1 GFlop/s; 1988; Cray Y-MP; 8 Processors
 - ▣ Static finite element analysis
- 1 TFlop/s; 1998; Cray T3E; 1024 Processors
 - ▣ Modeling of metallic magnet atoms, using a variation of the locally self-consistent multiple scattering method.
- 1 PFlop/s; 2008; Cray XT5; 1.5×10^5 Processors
 - ▣ Superconductive materials
- 1 EFlop/s; ~2018; ?; 1×10^7 Processors (10^9 threads)

Performance Development in Top500

Supercomputer

Incredible Cray-1
cruises at 80 million
operations a second

CRAY-1 computer is not much larger than its inventor, Seymour Cray. Outer seats cover the power supply (see below).

It's 10 times faster than the biggest IBM, with six times more memory

By JIM SCHEFTER

"Step into the computer," said my guide.

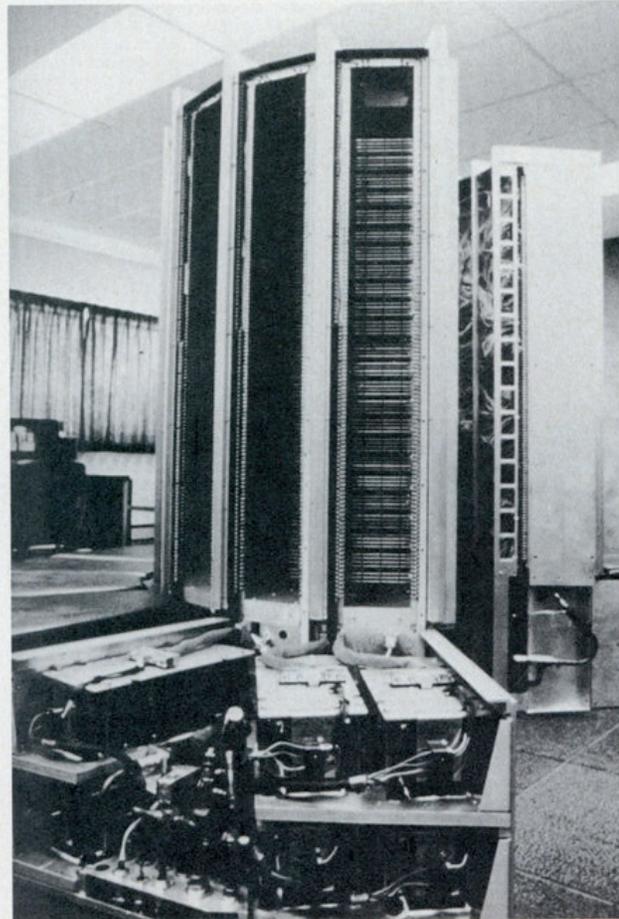

I did, and felt the chilling sensation of moving into the megabit maw of a machine so advanced in electronic intellect that it can only talk to other machines.

For a moment, I was apprehensive. It was like entering a silicon crypt. The air was significantly colder inside the polyhedral chamber than outside. Yet I knew that I was surrounded by hundreds of thousands of heat-producing electronic circuits, drawing six times as much electricity as any other machine in the room.

This was the CRAY-1, the amazing supercomputer designed by a reclusive Wisconsin genius. It's 10 times faster than the biggest IBM computer on the market. And this particular CRAY-1, installed in a major computer center in Kansas City, was being fed by two giant Control Data computers just to keep it busy.

"You're looking at the architecture of Seymour Cray," said a voice floating over the top of the computer.

The voice belonged to Jack Lorenz, president of United Computer Systems and owner of the first commercially installed CRAY-1 system. I saw what he meant. The CRAY-1 is unique, not only in electronic architecture and performance, but in size and shape as well. It doesn't look like any other computer.

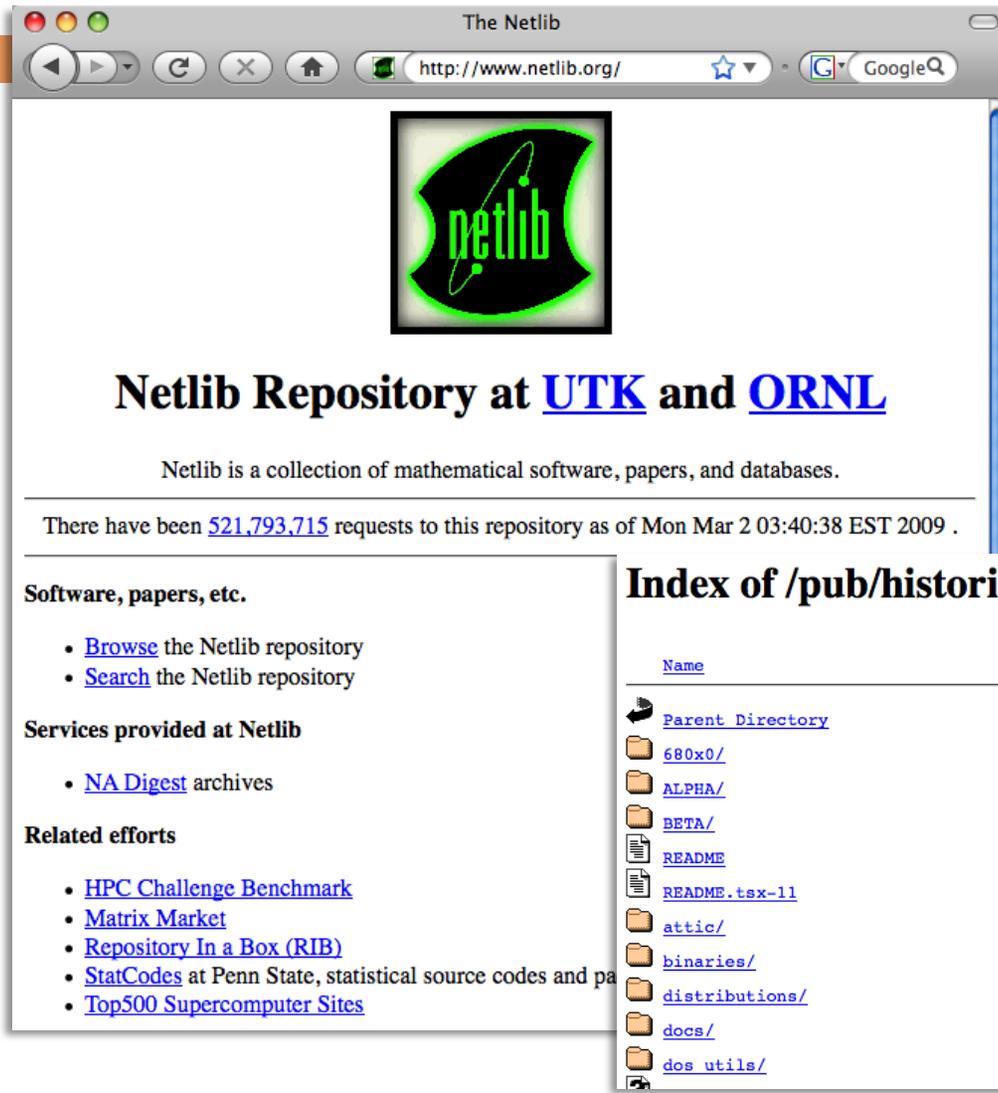

The Community is Diverse and Robust

- Over the last 10 years, the galvanization of the Open Source movement has dramatically improved HPC software

A very small sample:

- Linux Operating System, libc
- Python, Perl
- PAPI, TAU, Kojak
- UPC
- MPICH, OpenMPI
- ScaLAPACK
- VisIt
- GASNet, ARMCI/GA
- PVFS
- CFEngine, bconfig
- Ganglia
- SLURM, Cobalt
- Dyninst
- Torque/Moab, OpenPBS
- Charm++
- pNetCDF, HDF5
- GridFTP
- FFTW

A Long History of Collaboration & Sharing

The Netlib

The Result....

Average Number of Cores Per Supercomputer

Top20 of the Top500

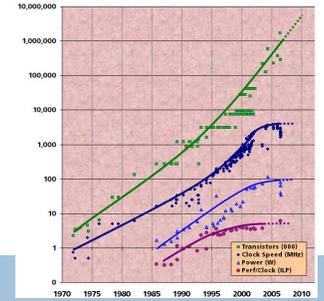

Factors that Necessitate Redesign

- **Steepness of the ascent from terascale to petascale to exascale**
- Extreme parallelism and hybrid design
 - ▣ Preparing for million/billion way parallelism
- Tightening memory/bandwidth bottleneck
 - ▣ Limits on power/clock speed implication on multicore
 - ▣ Reducing communication will become much more intense
 - ▣ Memory per core changes, byte-to-flop ratio will change
- Necessary Fault Tolerance
 - ▣ MTTF will drop
 - ▣ Checkpoint/restart has limitations
- **Software infrastructure does not exist today**

Potential System Architectures

| Systems | 2015 | 2018-2020 |
|------------------------|-----------------|-------------------|
| System peak | 100-200 Pflop/s | 1 Eflop/s |
| System memory | 5 PB | 10 PB |
| Node performance | 200-400 Gflop/s | 1-10 Tflop/s |
| Node memory bandwidth | 100 GB/s | 200-400 GB/s |
| Node concurrency | O(100) | O(1000) |
| Interconnect bandwidth | 25 GB/s | 50 GB/s |
| System size (nodes) | O(100,000) | 100,000-1,000,000 |
| Total concurrency | O(50,000,000) | O(1,000,000,000) |
| Storage | 150 PB | 300 PB |
| IO | 10 TB/s | 20 TB/s |
| MTTI | days | O(1 day) |
| Power | ~10 MW | ~20 MW |

A Call to Action

- Hardware has changed dramatically while software ecosystem has remained stagnant
- Previous approaches have not looked at co-design of multiple levels in the system software stack (OS, runtime, compiler, libraries, application frameworks)
- Need to exploit new hardware trends (e.g., manycore, heterogeneity) that cannot be handled by existing software stack, memory per socket trends
- Emerging software technologies exist, but have not been fully integrated with system software, e.g., UPC, Cilk, CUDA, HPCS
- Community codes unprepared for sea change in architectures
- No global evaluation of key missing components

IESP Goal

Improve the world's simulation and modeling capability by improving the coordination and development of the HPC software environment

Workshops:

Build an international plan for developing the next generation open source software for scientific high-performance computing

Four Goals for IESP

- **Strategy for determining requirements**
 - clarity in scope is the issue
- **Comprehensive software roadmap**
 - goals, challenges, barriers and options
- **Resource estimate and schedule**
 - scale and risk relative to hardware and applications
- **A governance and project coordination model**
 - Is the community ready for a project of this scale, complexity and importance?
 - Can we be trusted to pull this off?

International Community Effort

- We believe this needs to be an international collaboration for various reasons including:
 - ▣ The scale of investment
 - ▣ The need for international input on requirements
 - ▣ US, Europeans, Asians, and others are working on their own software that should be part of a larger vision for HPC.
 - ▣ No global evaluation of key missing components
 - ▣ Hardware features are uncoordinated with software development

Where We Are Today:

- SC08 (Austin TX) meeting to generate interest
- Funding from DOE's Office of Science & NSF Office of Cyberinfrastructure
- US meeting (Santa Fe, NM) April 6-8, 2009
 - 65 people
- NSF's Office of Cyberinfrastructure funding
- European meeting (Paris, France) June 28-29, 2009
 - 70 people
 - Outline Report
- Asian meeting (Tsukuba Japan) October 18-20, 2009
 - Draft roadmap
 - Refine Report
- SC09 (Portland OR) BOF to inform others
 - Public Comment
 - Draft Report presented
- Oxford meeting, April 2010

Roadmap Purpose

- The IESP software roadmap is a planning instrument designed to enable the international HPC community to improve, coordinate and leverage their collective investments and development efforts.
- After we determine what needs to be accomplished, our task will be to construct the organizational structures suitable to accomplish the work

Key Trends

Requirements on X-Stack

- Increasing Concurrency
- Reliability Challenging
- Power dominating designs
- Heterogeneity in a node
- I/O and Memory: ratios and breakthroughs

- Programming models, applications, and tools must address concurrency
- Software and tools must manage power directly
- Software must be resilient
- Software must address change to heterogeneous nodes
- Software must be optimized for new Memory ratios and need to solve parallel I/O bottleneck

Four Goals for IESP

- **Strategy for determining requirements**

- clarity in scope is the issue

- **Comprehensive software roadmap**

- goals, challenges, barriers and options

- **Resource estimate and schedule**

- scale and risk relative to hardware and applications

- **A governance and project coordination model**

- Is the community ready for a project of this scale, complexity and importance?
- Can we be trusted to pull this off?

Fundamentals of Technology Roadmapping

| FAX: | (505) 843-4223 | (505) 843-4223 |

Abstract

Technology planning is important for many reasons. Globally, companies are facing many competitive problems. Technology roadmapping, a form of technology planning, can help deal with this increasingly competitive environment. While it has been used by some companies and industries, the focus has always been on the technology roadman as a product, not on

Goals for IESP

□ **Develop a comprehensive community software roadmap for Exascale systems**

- Identify those software capabilities that will be needed for fully functional exascale systems, what are the barriers and how can we overcome them
- Determine which elements will occur naturally and which elements need R+D investment
- Determine those components that have solid starting points and which that need *ab initio* efforts
- Determine which components are suitable for an open community development model

Goals for IESP

- **Develop an estimate of the resources required and timeline needed to develop the required software**

- Need to put the software element of exascale in appropriate budget and schedule context

- Need to understand the risks (technical, schedule and organizational)

- ◆ □ Need to distinguish between the applications software efforts and the systems software

- ◆ □ The software timeline should be aligned with that of the hardware (and precede it where possible)

Roadmap Components

- 4.1 Systems Software.....**
 - 4.1.1 Operating systems
 - 4.1.2 Runtime Systems
 - 4.1.2 I/O systems
 - 4.1.3 External Environments
 - 4.1.4 Systems Management.....
- 4.2 Development Environments.....**
 - 4.2.1 Programming Models
 - 4.2.2 Frameworks
 - 4.2.3 Compilers.....
 - 4.2.4 Numerical Libraries.....
 - 4.2.5 Debugging tools
- 4.3 Applications.....**
 - 4.3.1 Application Element: Algorithms.....
 - 4.3.2 Application Support: Data Analysis and Visualization
 - 4.3.3 Application Support: Scientific Data Management
- 4.4 Crosscutting Dimensions**
 - 4.4.1 Resilience.....
 - 4.4.2 Power Management
 - 4.4.3 Performance Optimization
 - 4.4.4 Programmability.....

Co-Design Vehicles

- Requirements:
 - Terascale today. Demonstrated need for exascale
 - Can achieve significant scientific impact in an important area such as climate, eng., lifesci, materials, physics
 - A realistic and productive development pathway to exascale can be mapped out over 10 years
 - Community has demonstrated experience in algorithm, software and/or hardware developments and willing to engage in the exascale co-design process

| | |
|---|--|
| 5. IESP Application Co-Design Vehicles | |
| 5.1 Representative CDVs | |
| 5.1.1 High Energy Physics/QCD | |
| 5.1.2 Plasma Physics/Fusion Energy Sciences (FES) | |
| 5.1.3 Notes on strategic development of IESP CDVs | |

An Example Development Community

The Apache Software Foundation *Meritocracy in Action.*

The Apache Software Foundation provides support for the Apache community of open-source software projects. The **Apache projects** are characterized by a collaborative, consensus based development process, an open and pragmatic software license, and a desire to create high quality software that leads the way in its field.

We consider ourselves not simply a group of projects sharing a server, but rather a *community of developers and users.*

This page will give you everything you always wanted to know about the foundation but were afraid to ask. The difference between membership and committership, who decides what, how elections take place, what's the philosophy behind the foundation. Come and see behind the

in incorporated in the United

ects by supplying hardware,

- o create an independent legal entity to which companies and individuals can donate resources and be assured that those resources will be used for the public benefit
- o provide a means for individual volunteers to be sheltered from legal suits directed at the

Apache Foundation

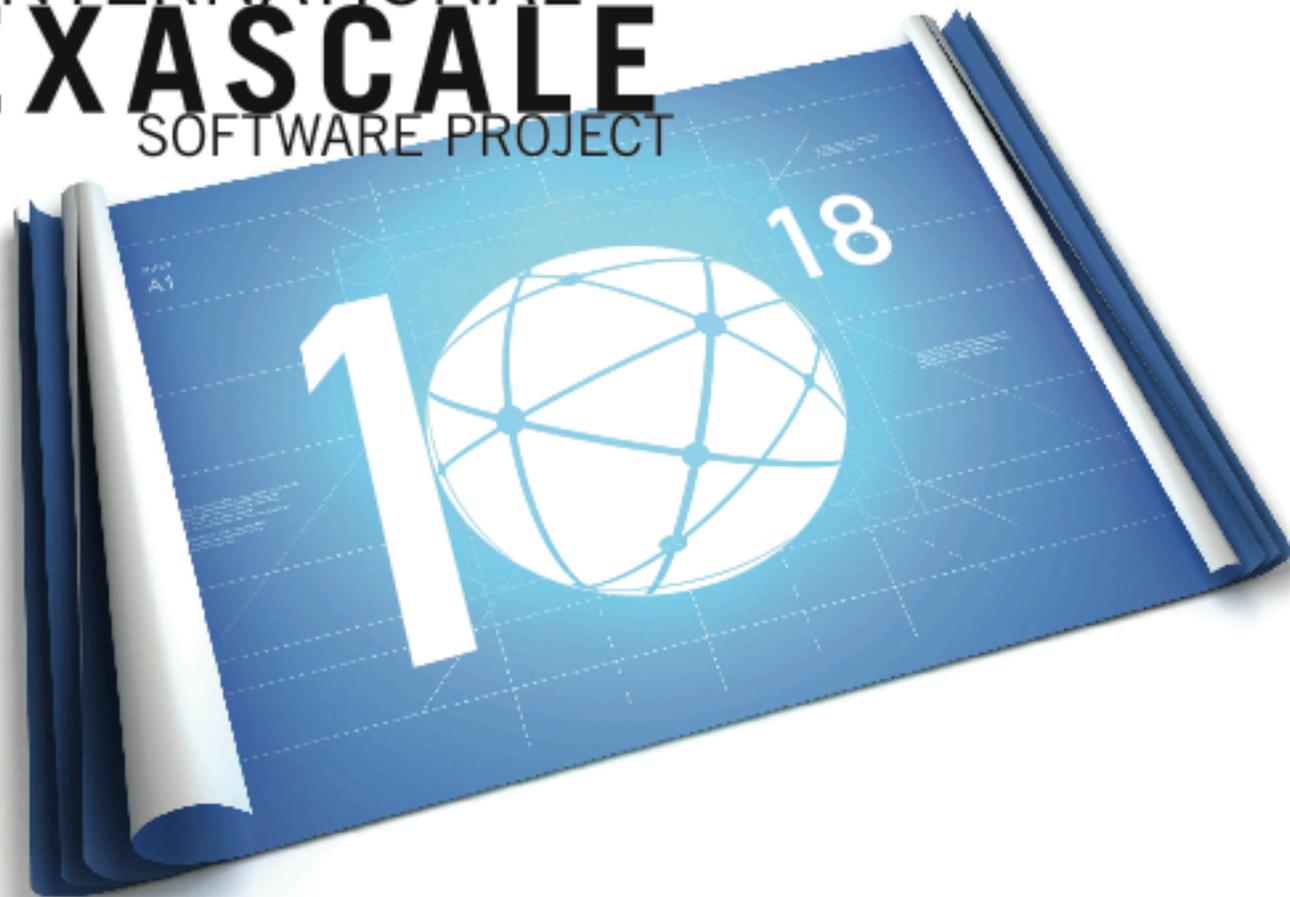

- Create a foundation for open, collaborative software development projects by supplying hardware, communication, and business infrastructure
- Incubator projects can become Apache projects
- 800 “committers”
- The ASF Infrastructure is mostly composed of the following services:
 - ▣ the web serving environment (web sites and wikis)
 - ▣ the code repositories
 - ▣ the mail management environment
 - ▣ the issue/ bug tracking
 - ▣ the distribution mirroring system

Next Steps

- Refine roadmap
- Develop organizational models
- Divide and conquer
